Design Spec

Our engineers suddenly and arbitrarily need an app to do madlibs! Your job is to create a tool to fill out madlibs and display them. You can use any frameworks or tools you want to do this.

A "mad lib" is: a phrasal template word game where one player prompts others for a list of words to substitute for blanks in a story, before reading the – often comical or nonsensical – story aloud.

Page Flow

Page #1: /input

Request the following words from the user:

- Name of person
- Place
- Past-tense verb
- Noun

Capture this input, and save it so that it can be used multiple times.

Page #2: /show

List out all of the saved sets of words, alongside a link to use those words in page #3.

For example, a table like:

```
-----------------------------------------------------------------
| Name of person | Place      | Past-tense verb | Noun |         |
-----------------------------------------------------------------
| Someone        | Somewhere  | Delayed         | Car  | Link to #3 |
-----------------------------------------------------------------
```

Page #3: ?

* Display the information from the previous page, filled into the following fields:

"One day, (name of person) went to (place) and (past-tense verb) the (noun)."

Page #4: /

Provide a starting page for someone to either go to page #1, or page #2.
